JavaScript Assignment #6 – Switch Statement (Using prompt & alert)

Scenario:

In real applications, systems **ask users for input** and then **show messages** based on their choice. Before learning forms or DOM, JavaScript provides **prompt** (to take input) and **alert** (to show output).

This assignment will help you practice:

- `switch` statement
- `prompt()` for user input
- `alert()` for displaying results

Steps to Build the Project

Step 1: Create Project Structure

- Create a new folder named:
  `js-assignment-6`
- Inside the folder, create two files:
  - `index.html`
  - `script.js`
- Connect JavaScript with HTML:
- `<script src="script.js"></script>`

Industry-Based Switch Statement Examples (With User Input)

Step 2: Employee Role Access System

Industry Scenario:
A company system asks for the **employee role** and shows access level.

Tasks:

- Use `prompt()` to ask:
  - "Enter your role (admin / manager / developer / intern)"
- Store the value in a variable.
- Use `switch` to decide access.
- Show result using `alert()`.

Example meaning:

- admin → Full system access
- manager → Team management access
- developer → Code access
- intern → Limited access

Step 3: Online Payment Method Selection

Industry Scenario:
An e-commerce website asks user to choose a **payment method**.

Tasks:

- Use `prompt()` to ask:
  - "Choose payment method (credit / debit / upi / cod)"
- Use `switch` to show payment message.
- Display message using `alert()`.

Step 4: Order Status Checker

Industry Scenario:
A customer checks the **status of their order**.

Tasks:

- Use `prompt()` to ask:
  - "Enter order status (placed / packed / shipped / delivered / cancelled)"
- Use `switch` to show status message.
- Display output using `alert()`.

Step 5: Office Working Day Checker

Industry Scenario:
An employee checks whether today is a working day.

Tasks:

- Use `prompt()` to ask:
  - "Enter day name (Monday – Sunday)"
- Use `switch` to show:
  - Working day
  - Half day
  - Holiday

Show result using `alert()`.

Step 6: Default Case (Very Important)

- In every `switch`, add a `default` case.
- Show message like:
  - "Invalid input. Please try again."

Instructions for Students

1. Write all JavaScript inside `script.js`.
2. Use **comments** to explain each case.
3. Use **prompt()** to take user input.
4. Use **alert()** to show output.
5. Test different inputs (correct & wrong).
6. Take screenshots of alerts.
7. Submit the complete folder or ZIP file.

What You Will Learn

- How to take user input using `prompt()`
- How to show messages using `alert()`
- How switch statement works in real systems
- How companies handle fixed user choices
